

S1 File: Supplementary Tables and Figures

Malaria vector species in Amazonian Peru co-occur in larval habitats but have distinct larval microbial communities

Catharine Prussing, Marlon P. Saavedra, Sara A. Bickersmith, Freddy Alava, Mitchel Guzmán, Edgar Manrique, Gabriel Carrasco-Escobar, Marta Moreno, Dionicia Gamboa, Joseph M. Vinetz, Jan E. Conn

Table I: Primer sequences

Use	Primer name	Sequence
ITS2 PCR-RFLP	CP16	5'-GCGGGTACCATGCTTAAATTTAGGGGGTA-3'
ITS2 PCR-RFLP	CP17	5'-GCGCCGCGGTGTGAACTGCAGGACACATG-3'
COI barcode sequencing	LCO1490	5'-GGTCAACAAATCATAAAGATATTGG-3'
COI barcode sequencing	HCO2198	5'-TAAACTTCAGGGTGACCAAAAAATCA-3'
Bacterial 16S rRNA sequencing	Illumina_Bakt341F	5'-TCGTCCGCAGCGTCAGATGTGTATAAGAGACAGCCTACGGGNGGCWGCAG-3'
Bacterial 16S rRNA sequencing	Illumina_Bakt805R	5'-GTCTCGTGGGCTCGGAGATGTGTATAAGAGACAGGACTACHVGGGTATCTAATCC-3'

Table II: Dates of Google Earth imagery used for distance to nearest forest calculations

Village	Month
Visto Bueno (VIB)	September 2016
Urco Mirañó (URC)	September 2016
Salvador (SAL)	September 2016
Libertad (LIB)	September 2016
Lupuna (LUP)	February 2017
Nuevo Horizonte (NHO)	November 2013
El Triunfo (TRI)	November 2013
Santa Emilia (SEM)	N/A – imagery not available for this village

Table III: Results of bivariate and multivariate logistic mixed-effects models for the presence of *Ny. darlingi* larvae

Variable*	Bivariate Odds Ratio (95% CI)	Bivariate <i>p</i> -value	Multivariate Odds Ratio (95% CI)	Multivariate <i>p</i> -value
Fixed effects

Total	1969		314	128	53	61

¹Excludes repeat diagnoses within 60 days for *P. vivax*, 30 days for *P. falciparum*

Fig I: Median-joining *COI* haplotype network for members of the *Nyssorhynchus* Oswaldoi-Konderi complex from the current study and from GenBank (S2 Dataset). Circles represent unique haplotypes and are colored based on species (GenBank sequences) or sample origin (sequences from this study). The size of each circle is proportional to the number of individual sequences sharing the haplotype. Black nodes indicate theoretical missing haplotypes, and hash marks represent mutation steps between haplotypes.

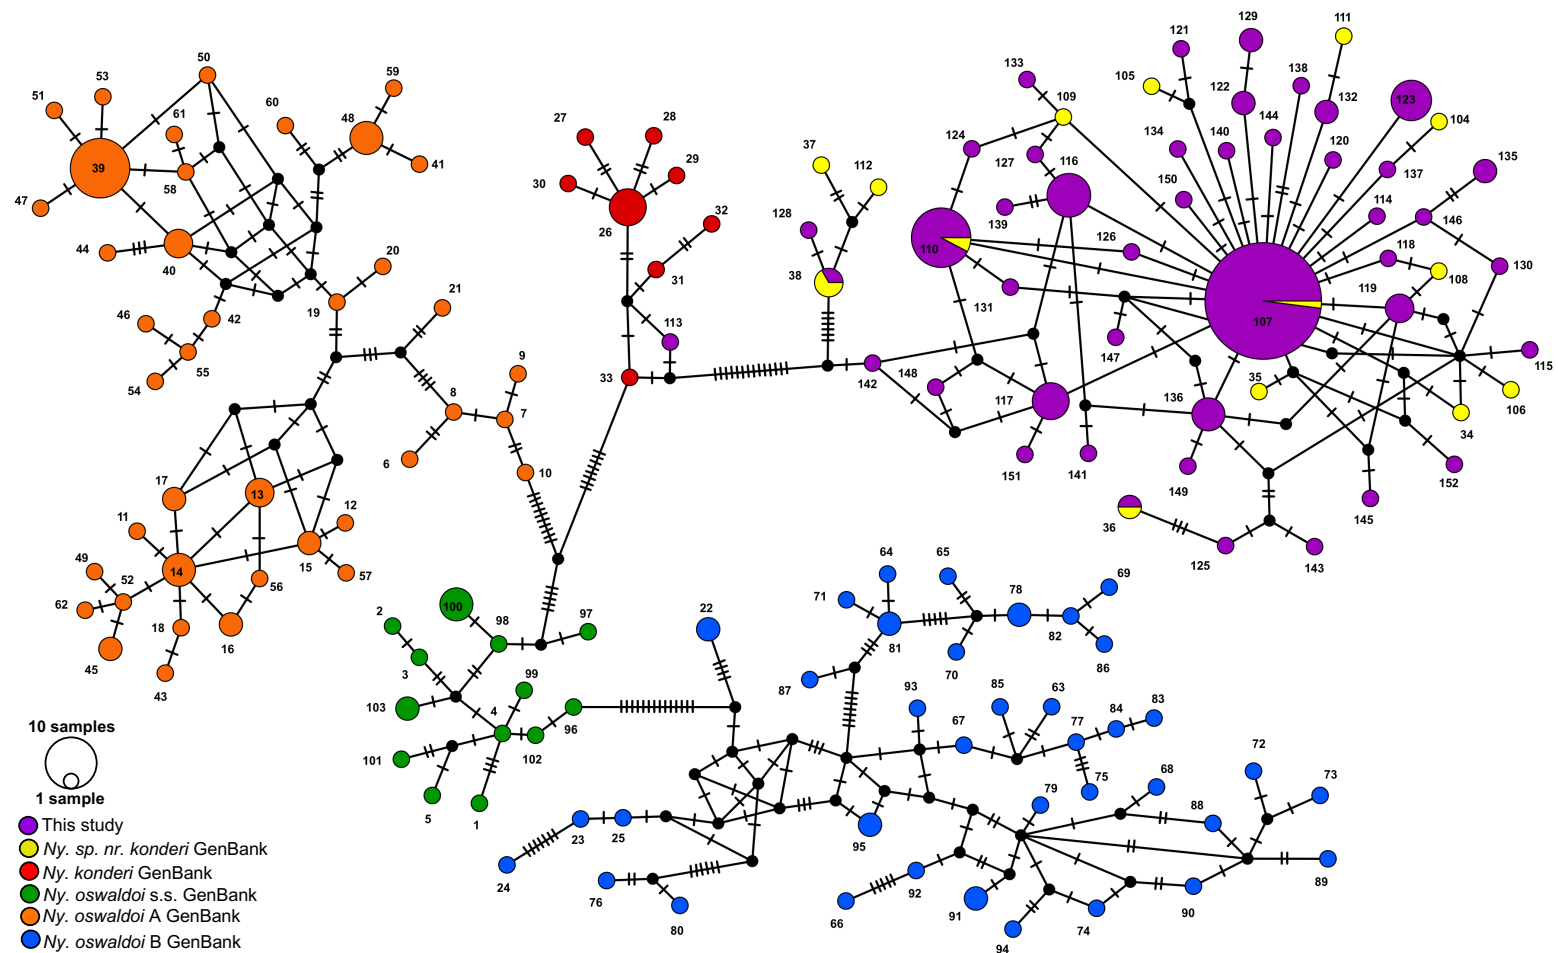

Fig II: Number and species of identified Anophelinae larvae by quarter in each village

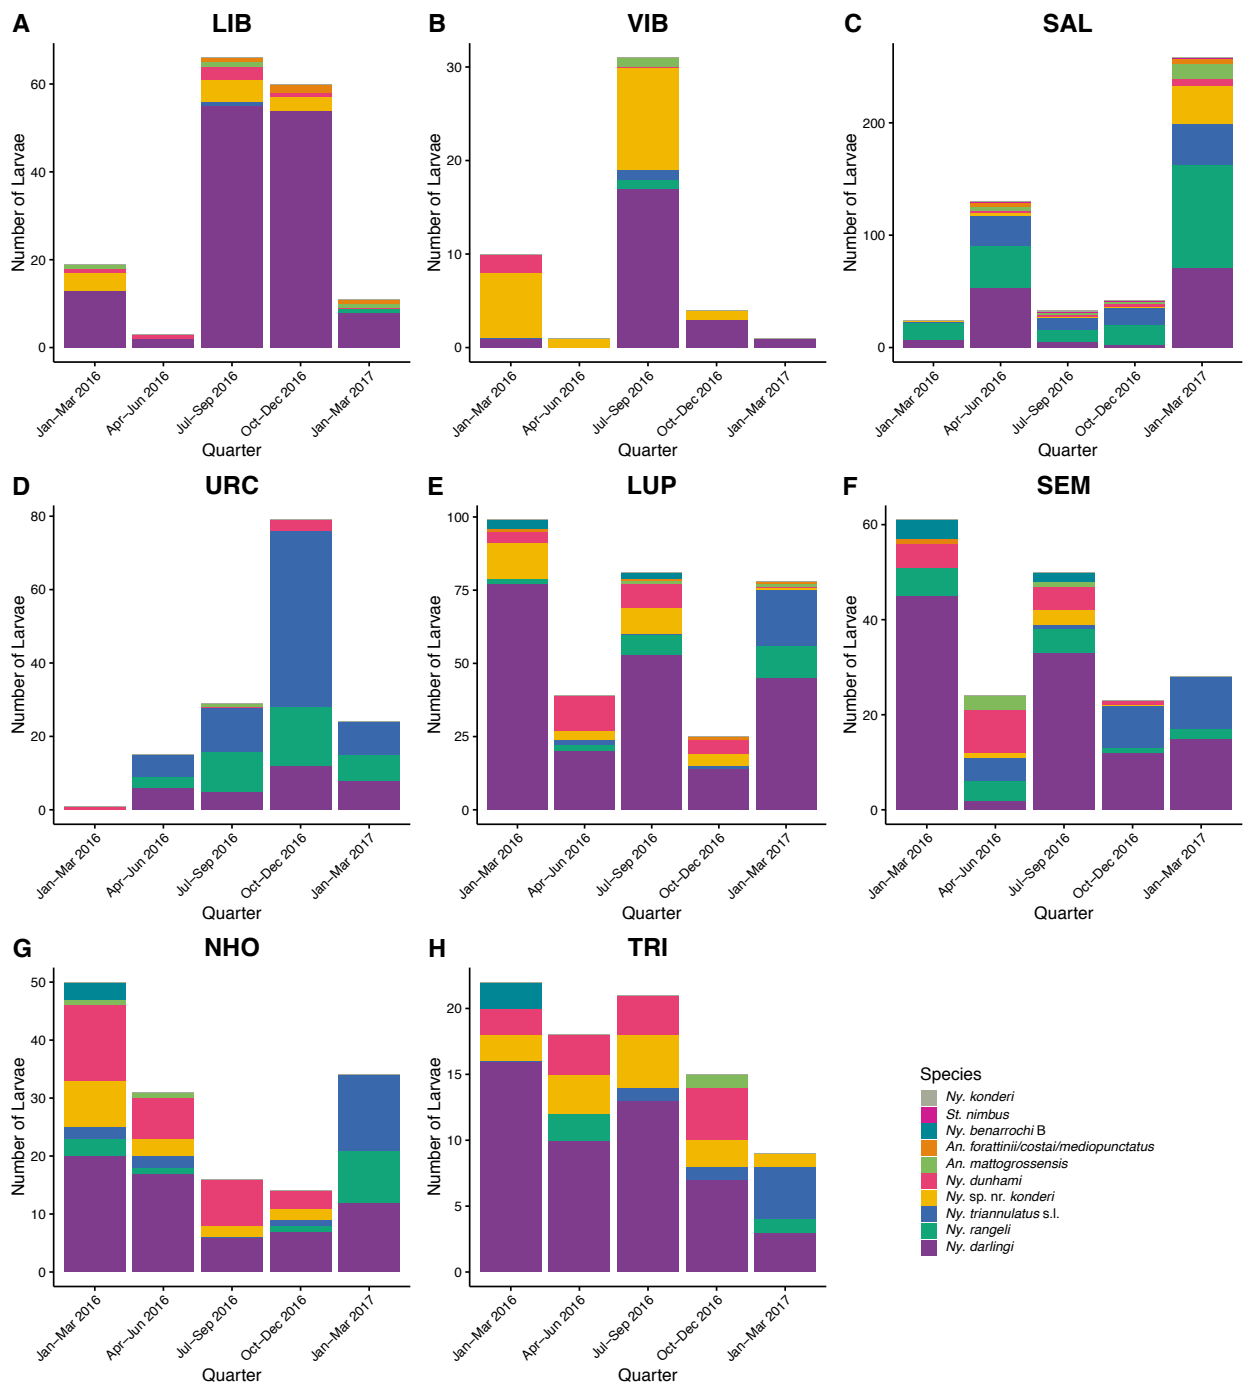

Fig IV: Alpha rarefaction curve from bacterial 16S rRNA sequencing, generated by sampling between 1 and 20,000 reads per larva, increasing in increments of 2,000 until the total number of reads per sample was reached. Ten iterations were computed at each step, and the smoothed mean number of OTUs observed for each larva at each step are shown.

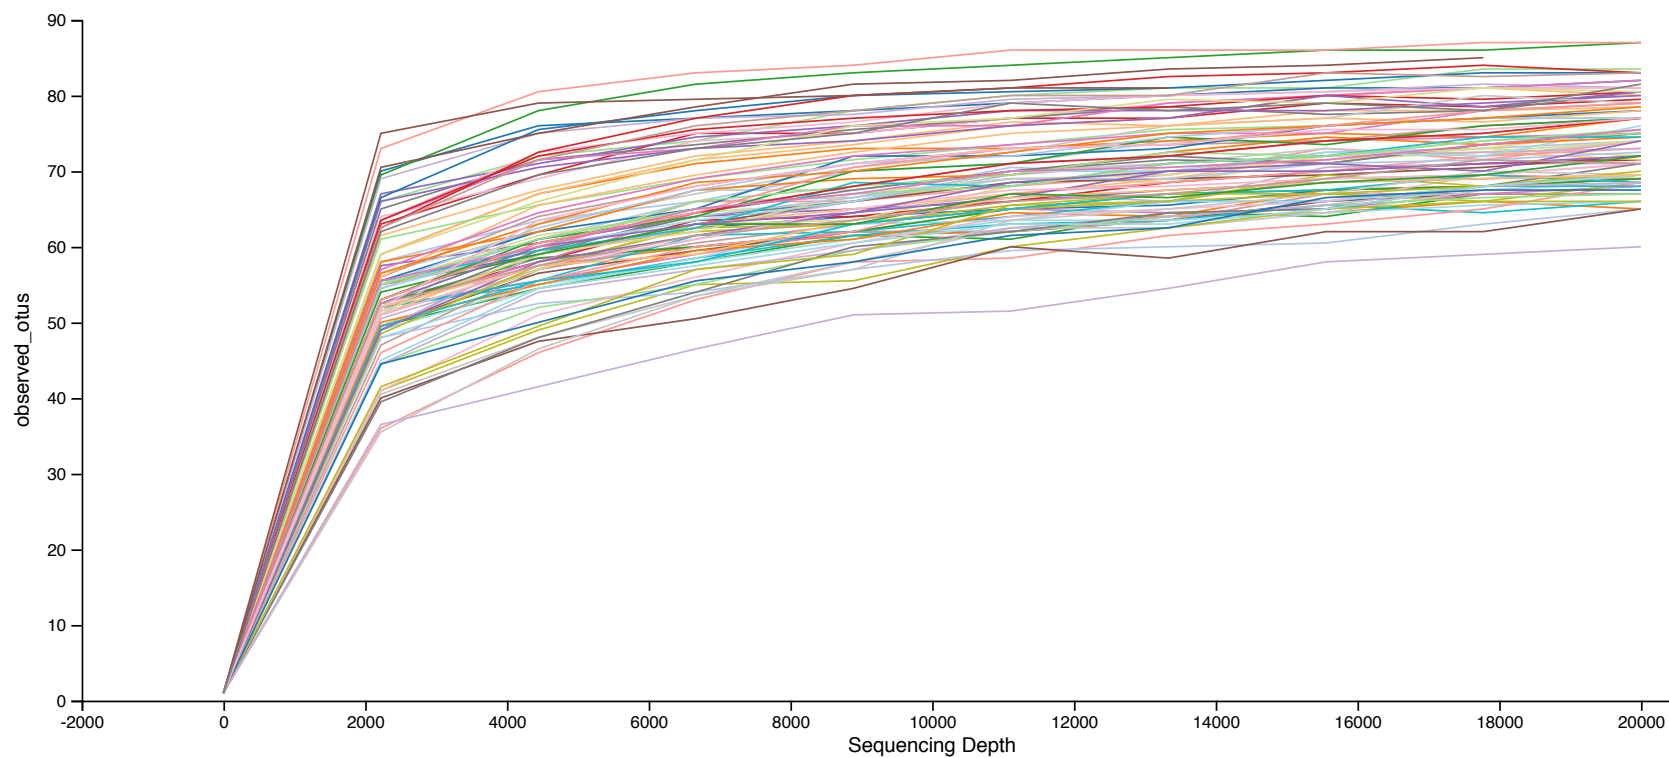

Fig V: Principal Coordinates Analysis (PCoA) of (A) weighted UniFrac, (B) Bray-Curtis distance matrices of *Nyssorhynchus* larval bacterial communities, with individual larvae colored by species. Ellipses indicate 95% confidence intervals around each species.

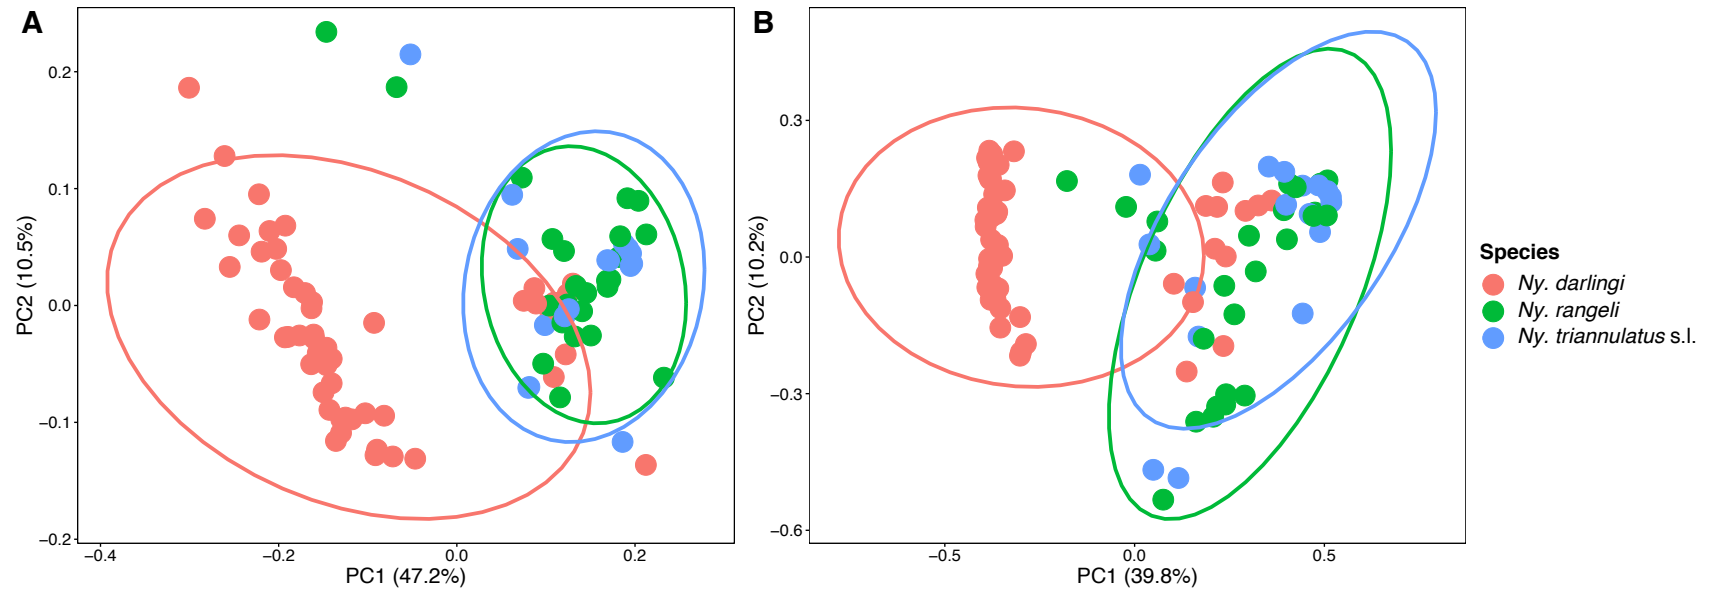

Fig VI: Principal Coordinates Analysis (PCoA) of (A) unweighted UniFrac, (B) weighted UniFrac, (C) Bray-Curtis distance matrices of *Nyssorhynchus* larval bacterial communities, with individual larvae colored by water body. Confidence intervals are not shown for clarity.

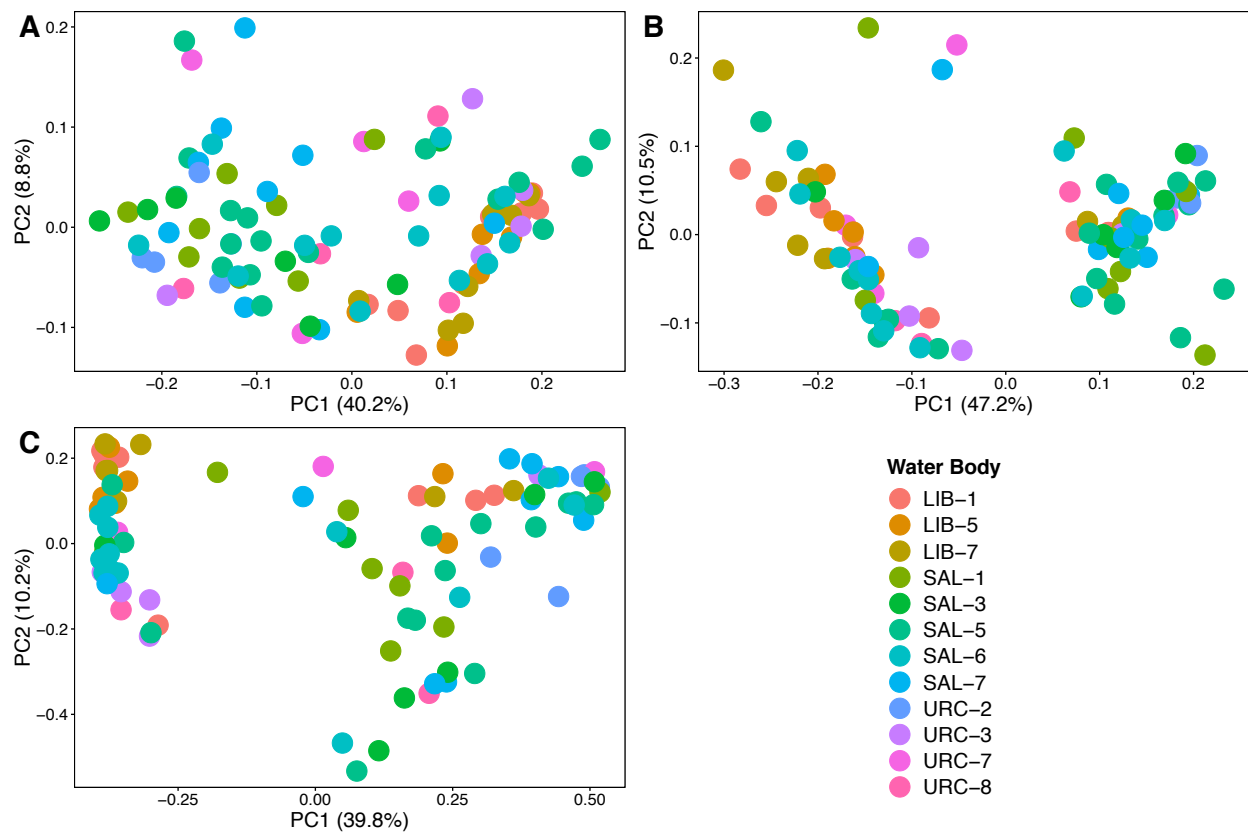

Fig VII: Bacterial family composition of each *Nyssorhynchus* larva, ordered by larval species (labels on top), then by water body ID (labels on bottom)
